 hasil canny
```

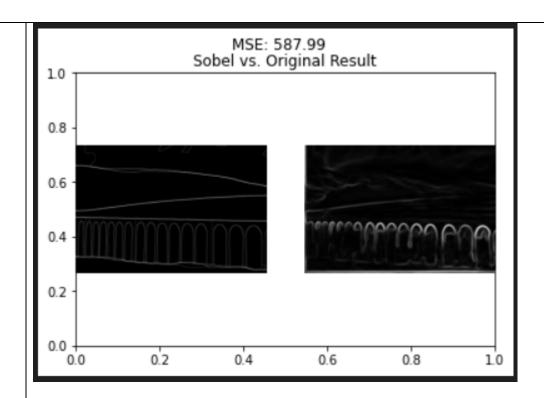

```
canny = edges

# hasil sobel
sobel = edges2

# hasil asli
result = cv.imread('6 result.jpg',0)

# compare images
compare_images(result, canny, "Canny vs. Original Result")
compare_images(result, sobel, "Sobel vs. Original Result")
```

Penjelasan:

Dari percobaan yang kami lakukan dapat dilihat hasil yang hamper mirip dari gambar yang ingin kita capai adalah dengan metode Sobel, karena memiliki jumlah MSE yang lebih kecil. Pada perbandingan diatas hasil dari Cany memang lebih jelas untuk garisnnya akan tetapi masih banyak benda yang seharusnya muncul tetapi idak muncul, sedangan dengan metede sobel kami berhasil memunculkan bebrapa garis yang kami tuju walaupun kurang jelas atau solid.
